

Introduction

Mid 1980's the Sinclair QL arrived with new storage devices **microdrive** 'mdv1_' & 'mdv2_'. It wasn't long before external **floppy drives** 'flp1_' & 'flp2_' were available and **Hard Drives** 'win1_' etc, followed soon after to open up the possibility of even larger storage capacities

The **QL Technical Guide** identified the **QL Filename** as being up to **36 Bytes** in length or the equivalent number in **ASCII Characters**. Viewing files using the original SuperBASIC **DIR** command displays a single vertical list. This soon spread over several pages and mistyping a file name became a frustrating exercise in using the **DIR** command to review the misspelling of filenames. The **QBITS** approach was to develop a more friendly **File Directory Handler**.

QBITS File Management Concepts

By 1987 a collection of SuperBASIC routines to keep track and review Filenames evolved into an early File Management Tool called File Tidy later shortened to **FTidy**. It accessed a Source Device and viewed up to 160 Filenames. **QBITS FTidy** was submitted to QUANTA shortly before Howard Clase published his **FTidy** program in QLWorld Sep1988.

QBITS FTidy128

The screen displayed four columns of file names of up to 18 characters. However, the full Filename of up to 36 characters, when selected was shown in the window below the Menu bar. **COPY** and **DELETE** commands allowed for single File or batch processing of multiple files. **SelDev** was used for **Source** and **Target** selection. The **Print** command was for Printer export of File lists. These were later dropped for **LOAD/LRUN**.

The **FDIR** with **SubDIR**ectories was added with Millennium updates. The latest version now includes **EXEC** and **VIEW** with **ASCII** or **HEX** Readout plus a **ZIP** option to Load and Compile a SuperBASIC File.

QBITS FTidySE

Screen layout is divided into four areas. Top centre the Title Box displays **QBITS FTidy⁺** at start up and prompts for Selection of a Source device shown in the bottom action window.

```
Select Drive: win1_ (↑↓) <ENTER>
```

The main display area shows a **Help** screen of Commands with a brief description of their functions. Navigation of Menu Commands and Displayed Filenames is by **←↑↓→** Cursor Keys with actions taken by **—** Spacebar **↵** Enter Keys. The Menu can also be Selected by individual Keys **F M S C D E L R V Z**. For Help screen Press 'i' for **Info**, Press 'E' **↵** to Exit/leave the program.

QBITS FTidySE File Directory

FDIR displays the **DIRectory** of the Default or last **Device** chosen. Full Filenames and Stats, Byte Size & Date/Time Stamp Entries of the Selected Storage Device are copied to **FList**. The list is then Read and Sorted Alphanumerically.

A Sort program was given in the QL Users Guide Chapter 16. A few tweaks with Array and Variable Names and Voilà! The Filenames of **FList** are selected sequentially by a **FOR loop** and compared within a **REpeat Loop** the output **DFile\$(n)** array sorted in Alphanumeric order. A second **FOR loop** selects any **SubDIRectory** names and lists them in front of the **Filenames**.

QBITS FTidySE SubDIRectories

The full identity of a file location can be 41 Characters. This begins with the Drive Device a five-character identifier, ie. mdv1_, flp1_, win1_, the fifth character being '_' an underscore. The next 36 Characters make up the Filename, with the first twenty-four characters considered for use as **SubDIRectory**'s. For example, 'SubDIR1_' which as with Drive names end with an underscore. If they were named with letters of the alphabet, 'A_' to 'L_' we could potentially create twelve **SubDIRectory** levels. **QBITS FTidy** limit is set at six **SubDIR** levels.

The File DIRectory [**FDIR**] or SubDIRirectories [**SDIR**] if present, display under **Volume** the **Device name**, **Volume/Sectors** and under **Files** the **Number** held in Directory. The Filenames of the selected **Device DIRectory** or **SubDIRectory** are Read and Sorted to generate the new display of Filenames. Any selected **Filename** is shown in full with Stats **Bytes** size and **Date/Time** Stamp in the lower action window.

QBITS FTidySE MDIR

Using the Line Editor create a new **SubDirectory** name.
QBITS six level **SubDIR** allocation is exemplated below...

```
Make SubDIR win1_  
Edit + + BkSp (←CTL→) Del →Rtn
```

DIM SubDIR\$(6,24) where SubDIR\$(1) = "SD1_" and SubDIR\$(6) access = "SD1_SD2_SD3_SD4_SD5_SD6_"

```
COPY win1_boot
Select using +↑↓= Alt ↑↓ ↵
```

```
COPY QBITS_File(s) TO win1_QBITS_
Change (D)rive (S)ubDIR (C)OPY File(s)
```

QBITS FTidySE COPY / DELETE

Select single or multiple files. The Filename(s) are identified by moving through the files listed and highlighting with the Spacebar. For **COPY** select a destination **Target** device with (D)rive and (S)ubDIR. Once the **Target DIR**ectory Filenames are shown Press (C)opy and the selected Filenames from **Source DIR**ectory are then copied across to the **Target** device. Any files of same name in destination device prompts for further action with an **Overwrite 'y/n'**.

```
DELETE win1_SpaceInvader_fnt 587 2023 Jan 07 10:59:30
Select using +↑↓= Alt ↑↓ ↵
```

Similarly, for **DELETE** the highlighted Filename is confirmed with 'y/n' before Deleting.

```
EXEC win1_progs_darts_v3_obj
```

```
LRUN win1_QBITS_Darts_v3
```

QBITS FTidySE EXEC / LRUN

Select a Filename, the full Filename up to 36 characters is displayed together with its Byte length and Time/Date Stamp. **EXEC** is for Object files, machine code files that can be loaded and run as an independent JOB. **LRUN** is for a S/SuperBASIC program that loads and runs under the QL Interpreter. For both you are prompted with 'y/n' to action.

```
RENAME win1_QBITS_Darts_v3
```

```
RENAME win1_QBITS_Darts_v3_
Edit + + BkSp (+CTL+) Del ↵ Rtn
```

QBITS FTidySE RENAME

Select an existing Filename (**file\$**) and **Edit** the string (**str\$**) with the **QBITS Line Editor**. Action with ↵ Enter and the **FTidy** checks that the Filename doesn't already exist. If not a **COPY** with new filename is made to source and the old file Deleted.

QBITS FTidySE VIEW

```
VIEW win1_QBITS_Darts_v3
```

View was seen as a useful option in being able to **OPEN** and read the contents a File. **S/SuperBASIC** Files are in **Plain Text**, others can be **Data** lists or a mix of code block and ASCII characters as in **Executable** computer readable machine code. **FTidy View** gives the option to display as **ASCII characters** (y) or in **Hex Bytes** (Enter).

```
VIEW win1_Aliens_fnt (y/n Entr)
Bytes: 588 <SPACEBAR> to continue... <ENTER> to Exit
```

```
ZIP win1_QBITS_QBITS_Darts_v3 8408 2023 Jan 08 19:45:42
Select using +↑↓= Alt ↑↓ ↵
```

QBITS FTidySE ZIP

Select a **SupeBASIC** File ie. with a '**_bas**' suffix. A Prompt (y/n Entr) appears. Press 'y' if Runtime is resident or 'Enter' if to be linked with program. Several programs can share **QLib_RUN** if installed or it can be linked as part of the Compile process. The compiler **Q_LIBERATOR** is installed if absent. Pressing 'n' returns to **FTidy Menu** bar.

When completed return to **QBITS FTidySE** with **ALT-f** and **EXEC Filename_obj** the Compiled Program.

```
COMPILE QBITS_QBITS_Darts_v3 (y/n Entr)
```

QBITS FTidySE use of LIBERATOR

An early notion was to include a link to Compile SuperBASIC Programs. In computing ZIP is a term for File(s) or Routines compressed into a package and descriptively can imply to go faster. A Spectrum BASIC Compiler written by N Goodwin was called ZIP. I hope he won't object to QBITS reuse of the word!

My choice of Compilers being SUPERCHARGE, TURBO or LIBERATOR and to maintain some compatibility across various QL Platforms. For the present QBITS_FTidy relies on the SMSQ/E O/S being in place and use of the QLBERATOR Sinclair QL Forum Edition 2020 for QPC2. Users should refer to the User Manuals for a better understanding of limitations with other environments.

QBITS FTidySE and Handling of Screen Positioning

Filenames are listed across the screen in columns and rows, each column having a defined number of characters or string length. If a name exceeds this length, then the name is truncated. If the name string is less, the missing characters are filled with spaces to overwrite the possibility of characters left over from a previously displayed Filename. If a Filename List exceeds the available screen space, upon reaching the bottom of the window the bottom row can be scrolled up and a new group of filenames added. To keep track a Line pointer identifies the position in the Filename list and a Row pointer for the screen position. A filename position can be identified by subtracting the Row pointer from the File Line pointer. A similar arrangement is utilised for scrolling the screen down so as to add rows at the screen top.

Note: A program having run its course needs to close down, release RAM etc and restore the system back to previous settings

Note: File & DIReCTory Info

QL Files appeared as an array of bytes on a physical storage device such as microdrives mdv1_, Floppy disks flp1_ and Hard drives win1_ etc.. The file storage system is composed of 512-byte blocks, so addressing is via an associated File Pointer by Block number (sector) and Byte number within that block. The QL Tech Guide describes a 64 Bytes File header as follows:

\$00	long	file length
\$04	byte	file access key (not yet implemented - set at 0)
\$05	byte	file type
\$06	8bytes	file type-dependant information
\$0E	2+36 Bytes	filename
\$34	long	reserved for update Date (not yet implemented)
\$38	long	reserved for reference Date (not yet implemented)
\$3C	long	reserved for backup Date (not yet implemented)

The file types allowed at the time of original QL:

- 2 a relocatable object file
- 1 an executable program where the first longword of the type-dependant information holds the default size of data space required for the program.
- 0 for anything else

QBITS FTidySE Procedures

Init_win	Initialises Program setting the screen display
F_Title	Displays QBITS Title / DIR headings
F_Info	Displays Info/Help screen
Cmd_Menu	Main Program Loop
SelDrv	Selects Source or Target Devices
FileDIR	Generates File List of Device DIRectory or a Sub DIRectory
F_Sort	Arranges Filenames AlphaNumerically with SubDIR(s) first
MakeDIR	Uses Line Editor to create a New SubDIRectory
SubDIR	Selects and displays the Filenames of a SubDIRectory
Sub_up	Move to Drive DIR or Higher-Level SubDIR
Sub_dn	Move to a Lower-Level SubDIR
F_Select	Use Cursor keys to Select a SubDIR or Filename
Fscr_posn	Calculate screen position of SubDIR or Filename
Fscr_up	Scroll up one row
Fscr_dn	Scroll down one row
F_write	Print SubDIR or Filename and Stats o screen position
F_clear	Prints updated File List to screen
F_Chk	Returns y/n Enter answer [no=0 yes=1 Enter=2
F_Copy	Selects and Confirms Filename(s) y/n? from Source Device
F_Target	Selects destination - Targeted Device DIR/SubDIR
F_Copy2	Copies File(s) to Target Device DIR SubDIR with overwrite y/n?
F_Delete	Deletes Selected Files(s) from Source Device y/n?
F_Lrun(act)	EXEC or Load/RUN selected File from displayed list
F_Rename	Uses Line editor to Rename a selected Filename
F_View	Prints ASCII or Hex Code of selected Filename to screen
F_ZIP	Selected SuperBASIC File linked into LIBERATOR Compiler
Ln_Ed	Line Editor action menu
Str_chk	Checks if last Character of string is ‘_’ and deletes
Ln_Prn	Prints Filename to Screen
Ln_Cur	Prints Current Cursor Position to Screen
Add_chr	Adds a character anywhere within String or at end.
Del_chr	Deletes a character anywhere in string
KQuit	Key Graphic Image created for Quit 
KInfo	Key Graphic Image created for Info/Help 
GDrive	Hard Drive symbol
GFolder	File Folder Symbol

QBITS FTidy SubDIRectories

The full identity of a file location can be 41 Characters. This begins with the Drive Device a five-character identifier, ie. mdv1_ flp1_ win1_ dos1_ the fifth character '_' always being an underscore. The next 36 Characters make up the Filename, of which the first twenty-four characters can be considered for **SubDIR**ectory use. For example, 'SubDIR1_' which as with Drive names have to end with an underscore. If they were named with letters of the alphabet, 'A_' to 'L_' we could potentially create twelve SubDIR levels. However, QBITS File Tidy is limited this to just SIX Sub levels, further levels will not be accessed by **SDIR**.

DIM SubDIR\$(6,24) where SubDIR\$(1) = "**SD1_**" and SubDIR\$(6) access = "**SD1_SD2_SD3_SD4_SD5_SD6_**"
